Frames: which sides, which corners

Each box below was asked for one thing, and says what it is and what to look at. Opened beside the HTML proof, the two must draw the same lines in the same places: every corner here is worked out once, for both.

Closed all round and square: the border every frame had. Nothing about it may have moved.

Translucent fill and border, square. The PDF fades both as the proof does, and the border lies over the fill.

Three corners rounded at 4 mm, the bottom left one square.

Border on the left and the top only, round at the corner where they meet. The other two sides stay open.

Border on the top and the bottom, every corner rounded: each rule stops where its corners begin, the fill does not.

A thick rule on the left only, its two corners rounded: it runs between them, straight.

Three sides and every corner rounded at 3 mm, the bottom side left open.

Every radius at 20 mm on a frame 15 mm high: all four are reduced together, and the ends come out as half circles.

Rounded at 5 mm and dashed: the dashes follow the curve.

Translucent fill and border, rounded at 6 mm.

A pen with no side to draw: the fill alone, rounded at 3 mm.

Below, a rule in green at 30 %: faded in the PDF as in the proof.
